Deliverable 1

Assumptions

We assumed that a clip could be in development, which implies that it might not have yet a released date/country, a rating, defined genres, defined languages and associated countries.

We also assumed that a movie staff (i.e. actor, director, producer or writer) doesn't necessarily have a bibliography.

Finally, in this relationship scheme, we imply that a movie staff can be in the data base without being associated to a movie (i.e. the directors' first movie is not released yet or simply isn't in our database)

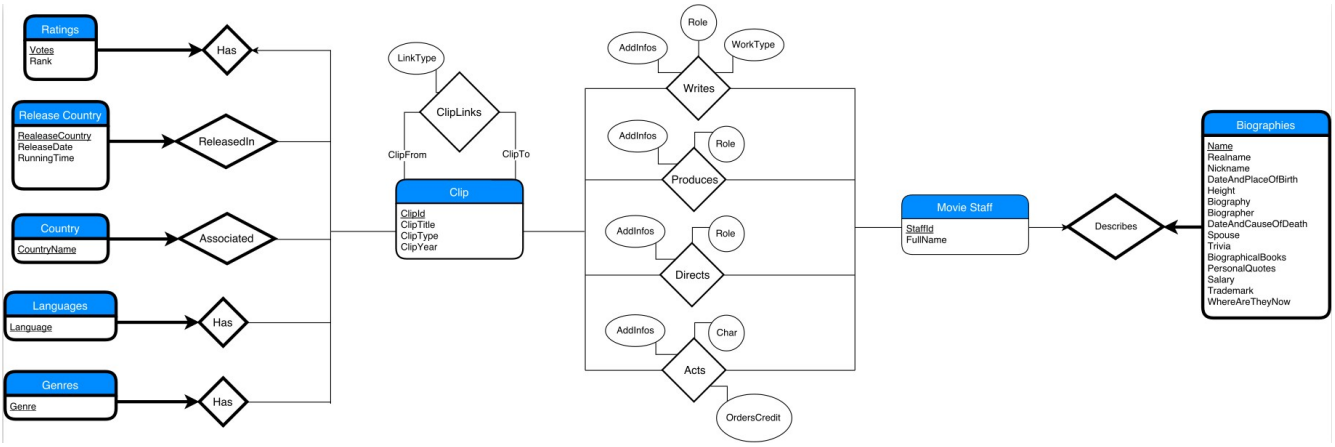
Entity Relationship Schema

Schema



Description

We regrouped the actors, producers, directors and writers into a single entity **Movie Staff** whose instances are identified by a unique *StaffId*.

A **Movie Staff** can be described by at most one **Biography**. A **Biography** describes exactly one **Movie Staff** which makes it a weak entity.

A **Movie Staff** can write, produce, direct or act in **Clip**s.

A **Clip** can have any number of ClipLinks with other **Clip**s.

A **Clip** can have **Genres**, have **Languages**, be associated to **Countries**, have **Release Countries** and have a **Rating**.

A **Genre** instance is a pair composed of a *ClipId* and a *Genre* so each instance is linked to exactly one **Clip**, this makes **Genres** be a weak entity of **Clip**.

Ratings, **Release Country**, **Country** and **Languages** are also all weak entities of **Clip** following the same reasoning.

General Comments

Firstly we tried to think individually about the logical possible relationships between actors, directors, clips etc. After having agreed on a version, we added constraints by looking at the data and using the course proposed book and course material.

Finally after the scheme was rectified, we created the DDL provided above.

We usually work together throughout the week, so there were no difficulties regarding meet ups and keeping a constant progress on the project.
